Ultra-rapids and ultra-rapid predictions for GPS

Jan Douša, Leoš Mervart

Geodetic Observatory Pecný (GOP), Research Institute of Geodesy, Topography and Cartography (RIGTC / VUGTK)

Dept. of Advanced Geodesy, Czech Technical University in Prague (CTU)

→ Centre for the Earth Dynamics Research (CEDR)

Introduction

GOP - Geodetic observatory Pecný of the RIGTC (Czech Rep)

- \rightarrow from 1999 developing the NRT GPS analysis
- → from 2000 contributing to European ground-based GPS meteorology (within COST-716, TOUGH projects)

GEODETIC OBSERVATORY PECN

 \rightarrow from January 2004, contributing to IGS with ultra-rapid orbits

Content

- Motivation from the application example
- Role of the ultra-rapids within the precise orbit products
- Introduce the orbit determination in GOP
- Summary

Application of IGU (& GOP) orbits to GPS meteorology (a driving motivation)

- ZTD results using IGU during identical 3-months in 2001 & 2002
- ZTD results using IGU & GOP during the COST-716 campaign

Simulated effect of orbit errors on ZTD

GEODETIC OBSERVATORY PECNY

(network solution)

GEODETIC OBSERVATORY PECNY Effect of systematic orbit error (cont'd) PRN=05 (star solution) 30.00 20.00 ZTD difference [mm] 10.00 0.00 RN=05 (star solution) -10.00 -20.00 Radial Err +1m -30.00 Al-track Err +1m Out-Plane Err +1m 10.Dec:00 10.Dec:03 10.Dec:06 10.Dec:09 10.Dec:12 10.Dec:15 10.Dec:18 10.Dec:21 11.Dec: ZTD differ -10.00 -20.00 Radial Err +1m -----30.00 Al-track Err +1m Out-Plane Err +1m

Error distribution of the ultra-rapid orbits

GEODETIC OBSERVATORY PECNY Satellite orbit quality & missing satellites IGS ultra-rapid [predicted 6-12h] x IGS final [2001,2002] Mean RMS Median RMS Ξ 3.5 Yearly mean/median positional RMS 2.5 1.5 0.5 Satellite (PRN number)

Precise orbit quality

GEODETIC OBSERVATORY PECNY Role of the ultra-rapids in other → post-processing features (accuracy) → real-time features (timeliness) (Predicted) Real-time **Final** Rapid **Ultra-rapid** rapid post-proc best rapid application RT RT post-proc post-proc RT oredicte fitted + pred? fitted + pred product fitted fitted (daily) daily daily daily data flow real-time hourly or RT 14 days 17 hours 17 hours x sec/min 3 hou s latency Caily daily sec/min subda daily upd.freq inevitable + 15 hours +x hours? + 48 hours prediction limited large network large large limited (large) full-automatic interaction full-automatic operation interaction interaction possible possible possible run run run

Ultra-rapid product 'extra' features

- product <u>aimed for fitted & predicted</u> portions
 - \rightarrow can accommodate a wide-spectrum of applications
- possible various strategies applied:
 - sliding window processing
 - x-hour batch processing with subdaily-NEQ stacking
 - rapid (daily-)NEQs + subdaily-NEQ stacking
 - previous precise orbits refined with nrt-DATA
 - real-time derived product
 - \rightarrow important for the robustness of the product
- dependence on <u>NRT/RT data</u> flow
 - \rightarrow important redundant, but independent access to data
- -<u>full-automatic run</u> necessary

 \rightarrow request on sufficient redundancy and IM of the analysis

IGR and IGU accuracy and completeness

Improved quality of IGS ultra-rapids

GEODETIC OBSERVATORY PECN

Significant quality improvements is comming with the CODE ultra-rapid contribution

Ultra-rapids in Geodetic Observatory Pecný

GEODETIC OBSERVATORY PECN

- January 2004 : GOP ultra-rapid solution contributes to IGS
- Bernese GPS software (V5.0beta), BPE & Perl scripts
- multi CPU i-686 architecture with Debian GNU/Linux

Analysis characteristics:

- 6-hour data pre-processing batches
- product updated every 3 hours
- orbits based on stacking the normal equations for last 3 days

global network solution split into the clusters

- various iterative procedures for robust, fully-automatic run
- satellite clocks not estimated, but included from broadcasts
- 10cm/20cm for fitted and 12h-predicted portions

with respect to the IGS final orbits

Nrt determination of the orbits in GOP

- hourly data from GOP NRT data center (global sites mirrored) concatenated broadcast messages for a priori orbits no manoeuvres information necessary
- → 6-hour data batch pre-processing regional clusters → global clusters improved 1-day orbit arcs
- 3-day orbit combination based on 6-hours normal equations comparing long-arcs to short-arcs orbits for additional orbit parameteres orbit quality evaluation for accuracy code, possible excluding satetellites
- 6-hour batch pre-processing using final GOP orbits 12-hour combined solution for <u>global NRT troposphere parameters</u>
 - product archived in GOP DC, web-monitoring, database updating, ...

GOP & IGU orbits : 2002 - 2004 operation

Future of the ultra-rapid orbits

GEODETIC OBSERVATORY PECI

IGS ultra-rapid orbits are already very important product for a wide spectrum of the applications

<u>a room for improvements :</u>

- integration further Global Navigition Satellite Systems
- completeness GPS satellites
- accuracy & timeliness faster update (3 6 hours)

to protect (/increase) robustness of the product by integration of: (at least during the period of different RT/NRT/daily data access)

- the use of various data flows (NRT, RT, DAILY)
- strategies balanced for the timeliness & accuracy for the orbit RT fitting × predicting
- → the use of various processing approaches !

GOP intentions within the IGS

GEODETIC OBSERVATORY PECN

To support the IGS ultra-rapid/NRT solutions <u>Motivations:</u>

- a) <u>shared effort</u> in accommodation of users' needs (orbits)
- b) <u>both-side profit</u> from the robust IGS ultra-rapid orbits
- c) support for the high-rate update cycle (\approx 4-8 / day)
- d) <u>feedback</u> from the global IGS combination which helps us to improve our solution

Future developments for the GOP orbits:

- to improve accuracy code !
- incorporate integer ambiguity re-solution
- further reduction of missing satellites (manoeuvres, SfW tech. problem)
- improve data-flow (secondary access to the global stations)
